Question 1

- 1 Two particles, A and B , are moving on a smooth horizontal surface when they collide. During the collision, the two particles coalesce to form a single combined particle. Particle A has mass 3 kg and particle B has mass 7 kg .

Before the collision, the velocity of A is $\begin{bmatrix} 6 \\ -2 \end{bmatrix} \text{ m s}^{-1}$ and the velocity of B is $\begin{bmatrix} -1 \\ 4 \end{bmatrix} \text{ m s}^{-1}$.

- (a) Find the velocity of the combined particle after the collision. (3 marks)
 (b) Find the speed of the combined particle after the collision. (2 marks)

Student Response

$3 \begin{bmatrix} 6 \\ -2 \end{bmatrix} + 7 \begin{bmatrix} -1 \\ 4 \end{bmatrix} = 10v$ ✓ M1A1
 $\begin{bmatrix} 18 \\ -6 \end{bmatrix} + \begin{bmatrix} -7 \\ 24 \end{bmatrix} = 10v$
 $\begin{bmatrix} 11 \\ 18 \end{bmatrix} = 10v$
 $v = \begin{bmatrix} 1.1 \\ 1.8 \end{bmatrix}$
 b) speed = $\sqrt{1.1^2 + 1.8^2} = 2.11 \text{ m/s (3sf)}$. ✓ M1A1F
 2
 2
 (4)

Commentary

This candidate has written down a correct statement at the start of the answer, which secures the first two marks for the question. However in the second line of working, a simple arithmetic error, circled by the examiner causes the loss of the final accuracy mark for part (a).

The answer to part (b) is now clearly incorrect, but as the candidate has used the correct method and obtained the correct speed for the velocity found in part (a). The script shows how the examiner has awarded follow through marks in this case.

This example illustrates how candidates can lose marks through minor errors and how the follow through marks can be awarded. It also shows the importance of a clear statement or equation at the start of the question to ensure that partial marks are awarded.

Mark scheme

<p>1(a)</p> $3 \begin{bmatrix} 6 \\ -2 \end{bmatrix} + 7 \begin{bmatrix} -1 \\ 4 \end{bmatrix} = 10\mathbf{v}$ $\mathbf{v} = \frac{1}{10} \begin{bmatrix} 11 \\ 22 \end{bmatrix} = \begin{bmatrix} 1.1 \\ 2.2 \end{bmatrix}$	<p>M1</p> <p>A1</p> <p>A1</p>	<p>3</p>	<p>M1: Forming three term equation for conservation of momentum, but condone incorrect signs. Question 2

2 A lift is travelling upwards and accelerating uniformly. During a 5 second period, it travels 16 metres and the speed of the lift increases from $u \text{ m s}^{-1}$ to 4.2 m s^{-1} .

(a) Find u . (3 marks)

(b) Find the acceleration of the lift. (3 marks)

Student response

2a) $t = 5$
 $s = 16$
 $u = u$
 $v = 4.2$
 $v = u + at$
 $s = u^2 + \frac{1}{2}at$ X
 $v^2 = 2(u+v)t$ X
 $17.64 = 2(u + 4.2)5$
 $17.64 = 2(4.2u)5$
 $17.64 = 8.4u \times 5$
 $17.65 = 42u$ X
 $\frac{17.65}{42} = u$ $u = 0.42 \text{ ms}^{-2}$ 6

b) $v = u + at$
 $4.2 = 0.42 + a \times 25$ X
 $4.2 = 0.42 + 25a$
 $4.2 - 0.42 = 25a$
 $3.78 = 25a$
 $\frac{3.78}{25} = a$ X
 $a = 0.15 \text{ ms}^{-2}$ 0

Commentary

This answer was produced by a candidate who has not been able to state the constant acceleration formula correctly. In part (a), the candidate states three formulae, of which unfortunately only one is correct. One of the incorrect formulae is then used in part (a) to obtain an incorrect value for the initial velocity.

In part (b), the candidate quotes the required formula correctly, but then substitutes the time squared instead of the time.

This example shows how candidates who do not learn the required formula and who are not proficient in their application will lose many of the relatively straight forward marks that are available on the papers.

Mark Scheme

<p>2(a)</p>	$16 = \frac{1}{2}(u + 4.2) \times 5$ $32 = 5u + 21$ $5u = 11$ $u = \frac{11}{5} = 2.2 \text{ ms}^{-1}$ <p>OR</p> <p>First solution from (b) to find acceleration followed by any constant acceleration equation to find u: eg.</p> $4.2 = u + 0.4 \times 5$ $u = 2.2$	<p>M1A1</p> <p>A1</p> <p>(M1) (A1) (A1)</p>	<p>3</p>	<p>M1: Using a constant acceleration equation to find u with $v = 4.2$ and $a \neq 9.8$. Total			6	

Question 3

3 A car is travelling in a straight line on a horizontal road. A driving force, of magnitude 3000N, acts in the direction of motion and a resistance force, of magnitude 600N, opposes the motion of the car. Assume that no other horizontal forces act on the car.

(a) Find the magnitude of the resultant force on the car. (2 marks)

(b) The mass of the car is 1200 kg. Find the acceleration of the car. (2 marks)

Student Response

Commentary

This candidate has calculated the resultant force correctly in part (a). The examiner has assumed that the R in the solution stands for the resultant force, not the normal reaction force which R appears to represent in the diagram.

In part (b) the candidate has included the weight in an equation which also involves the horizontal forces and so cannot find the acceleration.

This example illustrates some of the problems that the candidates have with drawing force diagrams and dealing with forces.

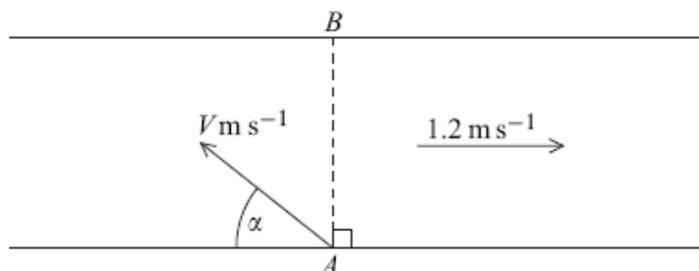

Mark Scheme

3(a)	Resultant Force = 3000 – 600 = 2400 N	M1 A1	2	M1: Difference between the two forces. A1: Correct magnitude of resultant force. Must be a positive answer. (600 – 3000 = –2400 scores M1A0)
(b)	2400 = 1200a $a = \frac{2400}{1200} = 2 \text{ ms}^{-2}$	M1 A1	2	M1: Use of Newton's second Law to find acceleration. A1: Correct acceleration ($a = \frac{-2400}{1200} = -2 \text{ ms}^{-2}$ scores M1A0)
Total			4	

Question 4

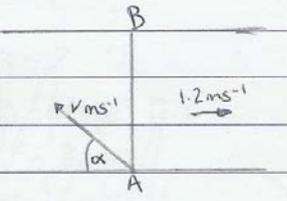

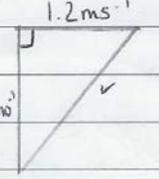

- 4 A river has parallel banks which are 16 metres apart. The water in the river flows at 1.2 m s^{-1} parallel to the banks. A boat sets off from one bank at the point A and travels perpendicular to the bank so that it reaches the point B , which is directly opposite the point A . It takes the boat 10 seconds to cross the river.

The velocity of the boat relative to the water has magnitude $V \text{ m s}^{-1}$ and is at an angle α to the bank, as shown in the diagram.

- (a) Show that the magnitude of the resultant velocity of the boat is 1.6 m s^{-1} . (1 mark)
- (b) Find V . (3 marks)
- (c) Find α . (2 marks)
- (d) State one modelling assumption that you needed to make about the boat. (1 mark)

Student Response

4)	 <p style="text-align: right;">$AB = 16\text{m}$ $t = 10\text{seconds}$</p>	
a)	$V = \frac{16}{10} \quad \therefore V = 1.6\text{ms}^{-1}$	✓
b)	 <p style="text-align: right;">$V = \sqrt{1.6^2 + 1.2^2}$ $V = \sqrt{4}$ $V = 2\text{ms}^{-1}$</p>	✓
c)	$\frac{2}{\sin 90} = \frac{1.2}{\sin \alpha}$ $2 = \frac{1.2}{\sin \alpha} \quad \therefore \frac{1.2}{2} = \sin \alpha$ $0.6 = \sin \alpha$ $\alpha = \sin^{-1} 0.6$ $\alpha = 36.9^\circ \text{ (BSF)}$	✓
d)	<p>There is no water resistance other than the river flow of the river.</p>	✗

Commentary

This candidate produces correct solutions to part (a) and (b) of the question and is clearly helped by the clear diagrams that were drawn to support these parts of the solution. The required division is shown clearly in part (a).

In part (c) the candidate finds an angle correctly, but does not realise that this is not the angle that the question has asked them to find. It is interesting that the candidate did not mark any angles, other than the right angle, on the diagram. It is quite possible that the candidate would have gained full marks if the angle that was found had been marked on the diagram.

The answer that this candidate gives in part (d) is not acceptable because the times and distances are specified in the question and these would take account of any resistance forces already.

This example shows the importance of clear diagrams in candidates' solutions.

Mark Scheme

Question 5

- 5 A block, of mass 14 kg, is held at rest on a rough horizontal surface. The coefficient of friction between the block and the surface is 0.25. A light inextensible string, which passes over a fixed smooth peg, is attached to the block. The other end of the string is attached to a particle, of mass 6 kg, which is hanging at rest.

The block is released and begins to accelerate.

- (a) Find the magnitude of the friction force acting on the block. *(3 marks)*
- (b) By forming two equations of motion, one for the block and one for the particle, show that the magnitude of the acceleration of the block and the particle is 1.225 m s^{-2} . *(5 marks)*
- (c) Find the tension in the string. *(2 marks)*
- (d) When the block is released, it is 0.8 metres from the peg. Find the speed of the block when it hits the peg. *(3 marks)*
- (e) When the block reaches the peg, the string breaks and the particle falls a further 0.5 metres to the ground. Find the speed of the particle when it hits the ground. *(3 marks)*

$v = 1.785 \text{ m s}^{-1}$	(13)

Commentary

This candidate has produced a good solution. The working is clearly shown and all steps taken are indicated. This is particularly important in part (b), which requires the candidates to show that the acceleration has the given value. The candidate begins part (b) with clear equations of motions for each body and then solves them to obtain the required acceleration.

In part (e) the candidate uses the correct initial velocity, but makes the mistake of using the wrong acceleration.

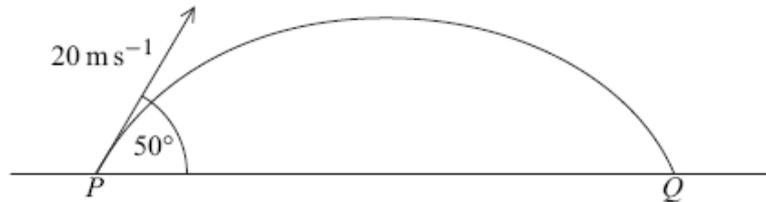

This example illustrates a really good solution to a “Show that” type of question.

Mark Scheme

5(a)	$R = 14 \times 9.8 = (137.2)$ $F = 0.25 \times 137.2$ OR $F = 0.25 \times 14 \times 9.8$ $F = 34.3 \text{ N}$	M1 M1 A1	3	M1: Finding the normal reaction. Accept 14g. M1: Use of $F = \mu R$ A1: Correct friction Use of $g = 9.81$ gives $R = 137.3$ and $F = 34.3$ so in this case do not penalise use of $g = 9.81$.
(b)	$6g - T = 6a$ $T - 34.3 = 14a$ $6g - 34.3 = 20a$ $a = \frac{6g - 34.3}{20} = 1.225 \text{ ms}^{-2}$ AG	M1A1 M1A1 A1	5	M1: Equation of motion for the particle, containing T , $6g$ or 58.8 and $6a$. A1: Correct equation with correct signs. M1: Equation of motion for the block, containing T , 34.3 or their F and $14a$. A1: Correct equation with correct signs. A1: Correct acceleration from correct working. If -1.225 is obtained from consistent working award 4 marks and if changed to $+1.225$ with an explanation, award full marks. Special Case: Whole string method $6g - 34.3 = 20a$ OE $a = 1.225$ award M1A1A1 Use of $g = 9.81$ gives $a = 1.228$ penalise use of $g = 9.81$ by deducting 1 mark, but don't penalise again on the same script.

Question 6

- 6 A ball is kicked from the point P on a horizontal surface. It leaves the surface with a velocity of 20 m s^{-1} at an angle of 50° above the horizontal and hits the surface for the first time at the point Q . Assume that the ball is a particle that moves only under the influence of gravity.

- (a) Show that the time that it takes the ball to travel from P to Q is 3.13 s , correct to three significant figures. *(4 marks)*
- (b) Find the distance between the points P and Q . *(2 marks)*
- (c) If a heavier ball were projected from P with the same velocity, how would the distance between P and Q , calculated using the same modelling assumptions, compare with your answer to part (b)? Give a reason for your answer. *(2 marks)*
- (d) Find the maximum height of the ball above the horizontal surface. *(3 marks)*
- (e) State the magnitude and direction of the velocity of the ball as it hits the surface. *(2 marks)*

Question number

Commentary

This candidate understands how to solve part (a) of the question, but fails to gain the final mark in this part because they include the statement $1.56 \times 2 = 3.13$. In order to have gained the final mark, the candidate should have produced a statement like $1.563 \times 2 = 3.126$ and then given the final answer as 3.13. In general, when asked to show a particular value to three significant figures, the candidates should give an answer to more than three significant figures and then round this to the required value.

The candidates gives good answers to parts (b), (c) and (d), although the examiner would have preferred to “the acceleration due to gravity” rather than just “acceleration” in part (c).

In part (e) The candidates had simply been expected to state the velocity with which the ball hits the surface. Many candidates however, went through the fairly long process of calculating the horizontal and vertical components of the velocity of the ball when its hits the surface and then using these to obtain the speed and direction of the ball at the time. The response from this candidate illustrates some interesting errors. In the first line of working the candidates writes “+” instead of “-“, as indicated by the examiner. However he does obtain the correct answer for this component, but subtracting rather than adding. In the line that begins with the word “downwards” the candidate shows what could be a correct expression for the speed if brackets were inseted as marked by the examiner. The line below is then correct, but unfortunately the candidate makes an arithmetic error.

This script again illustrates the need for candidates to fully justify their answers in “Show that” type questions and how candidates can be given the benefit of the doubt when they make slips in their working.

Question 7

7 A particle moves on a smooth horizontal plane. It is initially at the point A , with position vector $(9\mathbf{i} + 7\mathbf{j})\text{ m}$, and has velocity $(-2\mathbf{i} + 2\mathbf{j})\text{ m s}^{-1}$. The particle moves with a constant acceleration of $(0.25\mathbf{i} + 0.3\mathbf{j})\text{ m s}^{-2}$ for 20 seconds until it reaches the point B . The unit vectors \mathbf{i} and \mathbf{j} are directed east and north respectively.

- (a) Find the velocity of the particle at the point B . (3 marks)
- (b) Find the velocity of the particle when it is travelling due north. (4 marks)
- (c) Find the position vector of the point B . (3 marks)
- (d) Find the average velocity of the particle as it moves from A to B . (2 marks)

Student Response

Commentary

This candidate has produced good solutions to all parts of this question except for part (b).

Part (b) was found difficult by many candidates. This candidate, as did many others, begins with a correct statement about the \mathbf{i} component being zero, but is unable to form an equation from which to begin to work. In this case the candidate has used 3, which is the \mathbf{i} component of the velocity at time 20, but has not included the initial velocity. It is interesting to note that when the candidate calculates the velocity the answer includes a non-zero \mathbf{i} component, but this does not seem to worry the candidate.

There are two other points worth mentioning about this sample. The candidate has clearly crossed out any working that he does not want to be marked. This avoids the averaging of marks rule which is applied when candidates supply two complete, but different solutions.

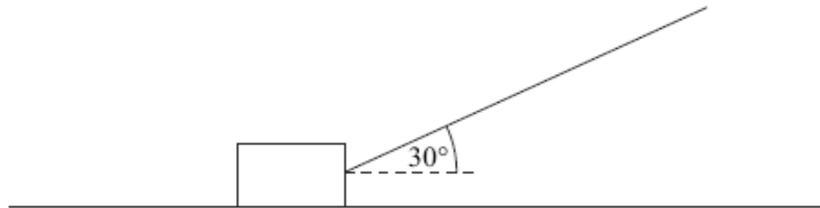

The other point can be seen in part (d). In the line that begins "distance AB" the candidate should have put brackets around the initial position, but as the working is correct on the next line the candidate is not penalised. Clearly it is better for candidates to ensure that the working they present is always correct, but examiners will give candidates the benefit of the doubt in cases like this.

Mark Scheme

7(a)	$\mathbf{v} = (-2\mathbf{i} + 2\mathbf{j}) + (0.25\mathbf{i} + 0.3\mathbf{j}) \times 20$ $\mathbf{v} = 3\mathbf{i} + 8\mathbf{j}$	M1 A1 A1	3	M1: Finding velocity using $\mathbf{v} = \mathbf{u} + \mathbf{a}t$. A1: Correct expression. A1: Correct velocity in simplest form.
(b)	$-2 + 0.25t = 0$ $t = 8 \text{ s}$ $\mathbf{v} = (2 + 0.3 \times 8)\mathbf{j} = 4.4\mathbf{j}$	M1A1 A1	4	M1: One component equal to zero (either \mathbf{i} or \mathbf{j} component). A1: Correct equation A1: Correct time A1: Correct velocity
(c)	$\mathbf{r} = (-2\mathbf{i} + 2\mathbf{j}) \times 20 + \frac{1}{2}(0.25\mathbf{i} + 0.3\mathbf{j}) \times 20^2 + (9\mathbf{i} + 7\mathbf{j})$ <p>OR</p> $\mathbf{r} = \frac{1}{2}((-2\mathbf{i} + 2\mathbf{j}) + (3\mathbf{i} + 8\mathbf{j})) \times 20 + (9\mathbf{i} + 7\mathbf{j})$ $\mathbf{r} = 19\mathbf{i} + 107\mathbf{j}$	M1 A1	3	M1: Finding position vector using a constant acceleration equation with or without the initial position with $t = 20$. A1: Correct expression for position vector including initial position.
(d)	$\mathbf{v}_{\text{AVERAGE}} = \frac{(19\mathbf{i} + 107\mathbf{j}) - (9\mathbf{i} + 7\mathbf{j})}{20}$ $= \frac{10\mathbf{i} + 100\mathbf{j}}{20}$ $= 0.5\mathbf{i} + 5\mathbf{j}$	M1 A1F	2	M1: Finding average velocity based on change of position. Subtraction of initial position must be seen or implied. Division by 8 scores M0 A1F: Correct average velocity. Follow through incorrect answers from part (c). Allow $\frac{\mathbf{u} + \mathbf{v}}{2}$

Question 8

- 8 The diagram shows a block, of mass 20 kg, being pulled along a rough horizontal surface by a rope inclined at an angle of 30° to the horizontal.

The coefficient of friction between the block and the surface is μ . Model the block as a particle which slides on the surface.

- (a) If the tension in the rope is 60 newtons, the block moves at a constant speed.
- (i) Show that the magnitude of the normal reaction force acting on the block is 166 N. *(3 marks)*
- (ii) Find μ . *(4 marks)*
- (b) If the rope remains at the same angle and the block accelerates at 0.8 m s^{-2} , find the tension in the rope. *(5 marks)*

Student Response

number		Leave blank
8.a.		
i.	$R = 20g - 60 \sin 30$ $R = 196 - 30$ $R = 166 \text{ N}$	3
ii.	$F = \mu R$ $F = 60 \cos 30$ $F = \mu R$ $60 \cos 30 = 166 \mu$ $51.96 = 166 \mu$ $\mu = 0.313$	4
b.		
	$F = \mu R$ $R = 20g - T \sin 30$ $F = T \cos 30 = 0.313 (20g - T \sin 30)$	1
	$F = Ma$ $T - 0.313(20g - T \sin 30) = 20 \times 0.8$ $T - (61.348 - 0.313 T \sin 30) = 16$ $T = 16 + (61.348 - 0.313 T \sin 30)$	
	$T - T \cos 30 = 20 \times 0.8$ $T - T \cos 30 = 16$ $T = 16 + T \cos 30$ $T = 13.9 \text{ N}$ $T = 16 + 0.866 T$	
	$\frac{T}{0.866} = 16$ $1.155 T = 16$	X

8

Commentary

This was a very typical response to this question, in that the candidate gains full marks for part (a) of the question. Many candidates then scored no marks on part (b). This candidate is a little different, in that they do gain one mark for giving correct expressions for the normal reaction and friction force, but do not gain any more marks because they do not apply Newton's Second Law correctly.

This script illustrates how challenging part (b) of this question was for many candidates.

Mark Scheme

8(a)(i)	$20 \times 9.8 = R + 60 \sin 30^\circ$ $(R =) 20 \times 9.8 - 60 \sin 30^\circ = 166 \text{ N} \quad \text{AG}$	M1 A1 A1	3	<p>M1: Equation or expression for normal reaction with mg or $20g$ or 196 and $60 \sin 30^\circ$ or $60 \cos 30^\circ$.</p> <p>A1: Correct equation or expression with correct signs.</p> <p>A1: Correct value from correct working. Must be positive.</p> <p>Don't penalise use of $g = 9.81$ if already done earlier on script. Should still get 166, but from 166.2.</p>
(ii)	$166\mu = 60 \cos 30^\circ$ $\mu = \frac{60 \cos 30^\circ}{166}$ $= 0.313$	M1 M1A1 A1	4	<p>M1: Use of $F = \mu R$, with $R = 166$ or 166.2. Do not allow inequalities here.</p> <p>M1: Resolving horizontally with $\cos 30^\circ$ or $\sin 30^\circ$ oe.</p> <p>A1: Correct equation</p> <p>Examples: $166\mu = 60$ M1M0A0 $166\mu = -60 \cos 30^\circ$ M1M1A0</p> <p>A1: Correct coefficient of friction.</p>
(b)	$20 \times 0.8 = T \cos 30^\circ - 0.313(20 \times 9.8 - T \sin 30^\circ)$ $T = \frac{20 \times 0.8 + 0.313 \times 20 \times 9.8}{\cos 30^\circ + 0.313 \sin 30^\circ} = 75.6 \text{ N}$	B1 M1 A1F dM1 A1F	5	<p>B1: $20g - T \sin 30^\circ$ oe seen.</p> <p>M1: Three term equation of motion, where normal reaction is dependent on T.</p> <p>A1F: Correct equation</p> <p>dM1: Solving for T including factorisation.</p> <p>A1F: Correct tension.</p> <p>AWRT 75.6</p> <p>Follow through incorrect values of μ from part (a).</p> <p>Don't penalise use of $g = 9.81$ if already done earlier on script. Should get 75.7.</p> <p>Allow 75.8 if intermediate values rounded.</p>
