5.

Figure 1

A small box of mass 15 kg rests on a rough horizontal plane. The coefficient of friction between the box and the plane is 0.2. A force of magnitude  $P$  newtons is applied to the box at  $50^\circ$  to the horizontal, as shown in Figure 1. The box is on the point of sliding along the plane.

Find the value of  $P$ , giving your answer to 2 significant figures.

7.

Figure 2

A beam  $AB$  is supported by two vertical ropes, which are attached to the beam at points  $P$  and  $Q$ , where  $AP = 0.3$  m and  $BQ = 0.3$  m. The beam is modelled as a uniform rod, of length 2 m and mass 20 kg. The ropes are modelled as light inextensible strings. A gymnast of mass 50 kg hangs on the beam between  $P$  and  $Q$ . The gymnast is modelled as a particle attached to the beam at the point  $X$ , where  $PX = x$  m,  $0 < x < 1.4$  as shown in Figure 2. The beam rests in equilibrium in a horizontal position.

(a) Show that the tension in the rope attached to the beam at  $P$  is  $(588 - 350x)$  N. (3)

(b) Find, in terms of  $x$ , the tension in the rope attached to the beam at  $Q$ . (3)

(c) Hence find, justifying your answer carefully, the range of values of the tension which could occur in each rope. (3)

Given that the tension in the rope attached at  $Q$  is three times the tension in the rope attached at  $P$ ,

(d) find the value of  $x$ . (3)

**Question 7 continued**

Leave  
blank

Handwriting practice area with horizontal lines.

N 3 4 2 7 5 A 0 1 7 2 4

8. [In this question  $\mathbf{i}$  and  $\mathbf{j}$  are horizontal unit vectors due east and due north respectively.]

A hiker  $H$  is walking with constant velocity  $(1.2\mathbf{i} - 0.9\mathbf{j}) \text{ m s}^{-1}$ .

(a) Find the speed of  $H$ .

(2)

Figure 3

A horizontal field  $OABC$  is rectangular with  $OA$  due east and  $OC$  due north, as shown in Figure 3. At twelve noon hiker  $H$  is at the point  $Y$  with position vector  $100\mathbf{j}$  m, relative to the fixed origin  $O$ .

(b) Write down the position vector of  $H$  at time  $t$  seconds after noon.

(2)

At noon, another hiker  $K$  is at the point with position vector  $(9\mathbf{i} + 46\mathbf{j})$  m. Hiker  $K$  is moving with constant velocity  $(0.75\mathbf{i} + 1.8\mathbf{j}) \text{ m s}^{-1}$ .

(c) Show that, at time  $t$  seconds after noon,

$$\overrightarrow{HK} = [(9 - 0.45t)\mathbf{i} + (2.7t - 54)\mathbf{j}] \text{ metres.}$$

(4)

Hence,

(d) show that the two hikers meet and find the position vector of the point where they meet.
